Polycystic Ovary Syndrome (PCOS)

Estimates suggest that polycystic ovary syndrome (PCOS) affects between 8% and 20% of reproductive-age women worldwide.1

Because there is no universal definition of PCOS, the exact number of women in the United States with PCOS is unknown, but is thought to be approximately 5 million.2,3

Most women are diagnosed during their twenties or thirties, but PCOS may affect girls as young as 11 who haven't even had their first period.4

Women are at higher risk for PCOS if they have a mother or sister with PCOS or are obese.5,6

Health burden of over $4 billion dollars in the United States alone.7
